Global Climate Disclosure Cheat Sheet

Three frameworks reshaping global climate reporting — and the data each one demands

Jana Earth Data | info@jana.earth | May 2026

1 EU CSRD (2025 to 2028 (phased))

The EU Disclosure Layer — comprehensive sustainability reporting

WHAT IT IS

EU directive replacing NFRD. Requires comprehensive sustainability reporting against the European Sustainability Reporting Standards (ESRS) on a "double materiality" basis (financial impact and impact on people / planet). Approximately 50,000 firms in scope, including non-EU firms with significant EU presence.

WHAT FIRMS MUST DO

Annual sustainability report alongside financial statements, audit-assured. Wave 1 (2025) for large public-interest entities filing FY2024 data. Wave 2 (2026) for other large companies. Wave 3 (2027) for listed SMEs. Listed SMEs in scope by 2028.

DATA NEEDED

Scope 1, 2, and 3 emissions including value chain. Facility-level data preferred for material emission sources. Quantitative climate risk disclosures. Climate transition plan with measurable targets. Supplier emissions for upstream Scope 3.

JANA FIT

Climate TRACE: verified facility-level emissions for own operations and value-chain mapping. EDGAR: sector baselines for Scope 3 where facility-level isn't available. Cross-source joins enable portfolio aggregation. Replaces self-reported and estimated supplier data with audit-defensible measurements.

2 ISSB / IFRS S1 + S2 (2026 to 2027 reporting years)

The Global Baseline — climate disclosure aligned to one standard

WHAT IT IS

International Sustainability Standards Board's global baseline for sustainability and climate disclosure. S1 covers general sustainability-related financial information. S2 covers climate-specific disclosures. Adopted by 36+ jurisdictions including UK, Australia, Japan, Canada, and Nepal (as NSRS).

WHAT FIRMS MUST DO

Disclose Scope 1, 2, and 3 emissions. Climate-related risks and opportunities. Scenario analysis. Transition plans. Industry-specific metrics from SASB-aligned guidance. Aligned with TCFD framework.

DATA NEEDED

Facility-level Scope 1 and 2 emissions. Scope 3 calculated via PCAF methodology, which scores data quality tier 1 (facility-measured) to tier 5 (sector-averaged estimates). Audit-grade data quality required. Time-series for trend analysis.

JANA FIT

Climate TRACE provides PCAF tier 1-2 quality (satellite-verified, facility-level). EDGAR fills sector gaps not yet covered at facility level (tier 3). Standardized methodology and consistent units across all data sources support audit defensibility.

3 EU CBAM + SFDR (2026 forward)

The Market Layer — carbon tariff and fund-product classification

WHAT IT IS

CBAM (Carbon Border Adjustment Mechanism): EU tariff on embedded emissions in imports of cement, steel, aluminum, fertilizer, hydrogen, and electricity. Definitive period from January 2026 with first verified emissions filings due. SFDR (Sustainable Finance Disclosure Regulation): classifies financial products into Article 6, 8, or 9 by sustainability profile.

WHAT FIRMS MUST DO

CBAM: importers calculate, report, and pay tariffs based on verified embedded emissions from overseas producers. SFDR: fund managers classify products and disclose alignment with EU Taxonomy plus Principal Adverse Impact (PAI) indicators on a portfolio basis. Greenwashing enforcement tightening across both.

DATA NEEDED

CBAM: facility-level emissions data for individual overseas producers of imported goods. SFDR: portfolio-wide ESG and climate data; PAI metrics; EU Taxonomy alignment; facility-level emissions for portfolio attribution.

JANA FIT

CBAM: Climate TRACE has verified facility-level emissions for cement, steel, aluminum, hydrogen, and fertilizer producers globally, a direct fit for importer compliance. SFDR: portfolio aggregation from facility-level data using PCAF methodology, EDGAR sector baselines, audit-ready provenance.

HOW THEY STACK

CSRD (2025-28) — Disclose comprehensively → **ISSB (2026-27)** — Standardize globally → **CBAM + SFDR (2026+)** — Trade and finance act

Each framework demands more granular, verifiable, facility-level data. Self-reported numbers and sector-averaged estimates are losing audit defensibility everywhere. **Jana provides the data infrastructure that makes compliance feasible across all three through one API integration.**
