

Demo meeting cue card

For a second-meeting demo with a Nepali bank, follow the format below. Goal: introduce the four tabs briefly, let the audio tour do the substantive walkthrough, then open discussion to scope a custom-development contract.

Tab introductions (two to three bullets each)

Loan Book (start here, this is the default tab)

- Simulated 80,000-loan portfolio for a hypothetical Class A bank.
- Real Climate TRACE 2024 facility emissions and EDGAR national totals underneath.
- Search, sort, and drill into any record.

ESRM

- Credit-decision workbench for new loan applications, mapped to NRB's 2018 directive.
- Each borrower carries satellite-verified emissions, an ownership chain, a risk classification, and a recommendation.
- The full ESDD checklist (NRB Annex 5) is one click away in the slide-over.

Taxonomy

- Portfolio classification under NRB's Green Finance Taxonomy (October 2024).
- Funnel makes the "small by count, large by value, all the regulatory exposure" story visible.
- The headline aggregates are what NRB sees on the quarterly submission.

NSRS

- Annual disclosure view: financed emissions, multi-year trend, PCAF data quality.
- IFRS S2-aligned, presentation currency is NPR.
- This is what would land in the annual sustainability report.

Closer before pressing play on the audio tour

"Rather than narrating, I'll let the audio walk us through the regulatory story in about three minutes. Sit back, and we'll talk about what fits your environment after."

Discussion prompts when the audio ends

- Which of the three workflows lands closest to where you are today, and where is the gap?
- What would the data flow look like at your bank, and which existing system would it sit alongside?
- Who in your team owns each of the three layers today, and where is the bottleneck?
- For the custom development you mentioned last time, what does the minimum viable deliverable look like for your next quarter or two?

The last prompt is the bridge to the contract conversation.

Quick reference if challenged on numbers

- **4.9% of Nepal's national CO₂ from one cement plant (Hongshi Shivam):** the full sanity check lives behind the "Open full sanity check" link on the ESRM tab under the share-of-national-CO₂ percentage. Backup writeup: docs/SANITY_CHECK_Hongshi_4.9_percent.md .
- **NSRS reporting in NPR:** per IFRS S1 paragraph 64, monetary disclosures must use the entity's presentation currency. For a Nepali bank that is NPR. PCAF Global Standard defers to the bank's reporting currency.
- **Risk assessments are filed internally, not with NRB:** NRB receives aggregates quarterly (counts of ESDD-screened loans, disbursements by risk rating, exclusion-list rejections). Individual transactions stay in the bank's loan file.
- **"In scope" includes SMEs:** the funnel's middle stage (about 10,000 loans for the simulated bank) includes SME and commercial loans, because ESRM and the Taxonomy apply to all business-purpose lending. Retail is out of scope.
